Preface	xv
Definitions	xix
Biographies of Mathematicians	xxii
Part 1. Background in analytic number theory	1
Chapter 1. How many primes are there?	3
1.1. The Prime Number Theorem	3
1.2. The first appearance of the Riemann zeta-function	6
1.3. Better understanding $\text{Li}(x)$, and quantitative notation	9
1.4. Notions of density	10
1.5. How good an approximation is $\text{Li}(x)$?	11
Questions on notation	11
Chapter 2. Unconditional estimates for sums over primes	13
2.1. Chebyshev's bounds	14
2.2. Explicit estimates for another weighted sum	16
2.3. Weights and the Prime Number Theorem	16
2.4. The von Mangoldt function	17
2.5. The Gamma function	18
Chapter 3. Partial summation, and consequences of the Prime Number Theorem	20
3.1. Partial summation	20
3.2. Special constants and useful formulas	21
3.3. The sum of the reciprocals of the primes, revisited	23
3.4. The error term in the Prime Number Theorem	24
3.5. The value of a limit	24
Chapter 4. What should be true about primes?	26
4.1. The Gauss-Cramér model for the primes	26
4.2. Short intervals	29
4.3. Largest gaps between primes	29
4.4. Even primes	30

Chapter 5. The modified Gauss-Cramér heuristic	32
5.1. Primes in arithmetic progressions	33
5.2. Twin primes	33
5.3. Prime k -tuplets	36
5.4. A general perspective	37
5.5. Convergence of the constant	39
Chapter 6. Multiplicative functions and Dirichlet series	40
6.1. Interesting multiplicative functions and their Dirichlet series	41
6.2. The mean value of the divisor function	43
6.3. Dirichlet's hyperbola trick	43
6.4. Maximum of arithmetic functions	45
Part 2. Anatomies of mathematical objects	47
Chapter 7. Counting irreducibles	49
7.1. Counting cycles in S_N	49
7.2. Counting irreducible monic polynomials in $\mathbb{F}_q[x]$	49
7.3. Generating functions	50
Chapter 8. The average number of indecomposables	52
8.1. The number of prime factors, on average	52
8.2. The number of disjoint cycles in a permutation, on average	52
8.3. The number of monic, irreducible factors, on average	53
Chapter 9. The typical number of indecomposables	54
9.1. The typical number of prime factors	54
9.2. The typical number of cycles in a permutation	55
9.3. The typical number of irreducible factors	56
9.4. Divisors	56
Chapter 10. Normal distributions	57
10.1. A distribution function for $\omega(n)$	57
10.2. The distribution of the number of monic, irreducible factors of a polynomial	59
10.3. The number of disjoint cycles in a permutation	61
Chapter 11. The multiplication table	63
11.1. A first look at $\pi(x; k)$	64
11.2. An explicit upper bound on $M(x)$	65
11.3. The largest part of the divisor sum	67
Chapter 12. With two or more parts	69
12.1. Integers with two or more prime factors	69
12.2. Permutations with exactly k disjoint cycles	70
12.3. Polynomials divisible by exactly k distinct irreducibles	71
Chapter 13. Poisson and beyond	73
13.1. More precision with permutation counts	74

Part 3. Sieves and primes	77
Chapter 14. The Chinese Remainder Theorem as a sieve	79
14.1. The sieve of Eratosthenes	79
14.2. Counting squarefrees and powerfals	81
14.3. Pairs of integers that are pairwise coprime	83
Chapter 15. A first look at sieve methods	84
15.1. Upper and lower bounds	84
15.2. Twin primes	86
15.3. Formulation of the sieve	87
15.4. Another upper bound sieve method: The Selberg sieve	88
15.5. Sieving almost all intervals; second moments	88
15.6. The fundamental lemma of sieving intervals	89
Part 4. Background in analysis	91
Chapter 16. Fourier series, Fourier analysis, and Poisson summation	93
16.1. Fourier series	93
16.2. Fourier transforms	96
16.3. Inequalities	98
16.4. Poisson summation	99
Chapter 17. Complex analysis	100
17.1. Complex analysis	100
Chapter 18. Analytic continuation of the Riemann zeta-function	104
18.1. The Riemann zeta-function is analytic in $\text{Re}(s) > 1$	104
18.2. A first analytic continuation	105
18.3. Riemann's analytic continuation	106
18.4. The logarithmic derivative of $\zeta(s)$	107
18.5. The zeros of the Riemann zeta-function	107
18.6. Evidence for the Riemann Hypothesis	109
Chapter 19. Perron's formula	110
19.1. Satisfying inequalities	110
19.2. Counting integers with certain properties	111
19.3. Perron's formula variants	113
Chapter 20. The use of Perron's formula	115
20.1. An arithmetic function as a sum of residues	115
20.2. The integrals for counting primes	117
Part 5. The proof of the Prime Number Theorem	119
Chapter 21. Riemann's plan for proving the Prime Number Theorem	121
21.1. A method to accurately estimate the number of primes	121
21.2. Linking number theory and complex analysis	122
21.3. Appreciating Riemann's revolutionary formula	124

21.4. Unconditional estimates for $\pi(x)$	125
Our plan	126
Chapter 22. Technical remarks	127
22.1. Deducing the Prime Number Theorem from (22.1)	128
22.2. A strong Prime Number Theorem implies the Riemann Hypothesis	129
22.3. A lower bound for the error term in the Prime Number Theorem	130
Chapter 23. Zeros of $\zeta(s)$ with $\operatorname{Re}(s) = 1$	131
23.1. Sketch of a “hands-on” proof	131
23.2. A formal proof	132
23.3. Truncating Euler products	133
Chapter 24. Proof of the Prime Number Theorem	134
24.1. The error term in the Prime Number Theorem	135
Chapter 25. The Riemann Hypothesis without zeros of $\zeta(s)$	136
25.1. The zeta-function to the right of $\operatorname{Re}(s) = 1$	136
25.2. Pluses and minuses	137
Part 6. Primes in arithmetic progressions	139
Chapter 26. Primes in arithmetic progressions	141
26.1. Dirichlet’s plan	141
Chapter 27. Dirichlet characters	144
27.1. Classification of the Dirichlet characters	144
27.2. Particularly useful characters	146
27.3. Orthogonality relations	147
Chapter 28. Dirichlet L -functions	149
28.1. Analytic continuation to $\operatorname{Re}(s) > 0$	149
28.2. L -functions on the 1-line	150
28.3. Infinitely many primes in an arithmetic progression	151
28.4. Dirichlet’s class number formula	153
Chapter 29. The Prime Number Theorem for arithmetic progressions	155
29.1. Formulating our proof	156
29.2. Obtaining estimates	157
29.3. Low height zeros	157
Chapter 30. The Generalized Riemann Hypothesis	159
30.1. The Riemann Hypothesis for $L(s, \chi)$	159
30.2. The least quadratic non-residue modulo a prime	160
30.3. The range of definition of the Euler product	161
Part 7. A dozen and one different directions	163
Chapter 31. Exceptional zeros and primes in arithmetic progressions	165
31.1. PNT for arithmetic progressions	165
31.2. Linnik’s Theorem	166
31.3. Using exceptional zeros	166

31.4.	Repulsion effects	166
31.5.	Siegel's Theorem	167
31.6.	Upper bounds on the number of primes with $\chi(p) = 1$	167
Chapter 32.	Selberg's small sieve	169
32.1.	Sieving the integers in an interval	169
32.2.	Deducing results for arithmetic progressions	171
32.3.	Selberg's sieve in more generality	173
32.4.	Sieving k -tuplets	173
32.5.	Sieving several arithmetic progressions	174
Chapter 33.	Equidistribution in arithmetic progressions?	176
33.1.	The correct error term?	176
33.2.	The Brun-Titchmarsh Theorem	176
33.3.	The Bombieri-Vinogradov Theorem	177
33.4.	Breaking the $\sqrt{x}$ -barrier	178
33.5.	For almost all q , almost all a	178
33.6.	Not so well distributed	179
Chapter 34.	Distribution of the error term in the Prime Number Theorem	181
34.1.	Linear independence	182
34.2.	Developing a model	183
34.3.	$\pi(x) > \text{Li}(x)$	184
34.4.	Large error terms	185
34.5.	Rubinstein-Sarnak	185
34.6.	Primes in short intervals	186
Chapter 35.	Chebyshev's bias	188
35.1.	Bias mod q	189
35.2.	Racing arithmetic progressions	190
Chapter 36.	Primes in short intervals	192
36.1.	Primes in intervals of fixed length y , and of length $y \leq \log x$	192
36.2.	Primes in intervals $(x, x + y]$ with $y = \lambda \log x$ for fixed $\lambda > 0$	193
36.3.	Primes in intervals of length $(\log x)^A$ with $A > 1$	194
36.4.	Primes in intervals with $y/\log x \rightarrow \infty$ and $y/x \rightarrow 0$ as $x \rightarrow \infty$	195
Chapter 37.	Smooths, factoring, and large gaps between primes	197
37.1.	Upper and lower bounds for $\Psi(x, y)$	197
37.2.	Large y , small u	198
37.3.	Applications of smooth numbers	200
37.4.	Constructing large gaps between prime numbers	200
Chapter 38.	Short gaps between primes	203
38.1.	The Goldston-Pintz-Yıldırım (GPY) plan	203
38.2.	Error terms, and asking for more	205
38.3.	New sieve weights	206
38.4.	Pairs of consecutive primes	207
38.5.	Many primes in short intervals	208
38.6.	Fun corollaries	208
38.7.	Uniformity	209

Chapter 39. The circle method	210
39.1. Exponential sums	210
39.2. The circle method, I	211
39.3. Major and minor arcs	211
39.4. Twin primes and Goldbach	212
39.5. The ternary Goldbach problem	213
Chapter 40. Primes missing digits	215
40.1. Prime values	215
40.2. The missing digit problem	216
40.3. What makes restricted digit problems tractable?	217
40.4. The major arcs for $S_{\mathcal{A}}(\theta)$	217
40.5. Upper bounds when missing one digit in base q	218
40.6. Minor arcs. The mean value of $ S_{\mathcal{A}}(\alpha) $	219
Chapter 41. Towards the prime k -tuplets conjecture	220
41.1. Large Fourier coefficients	220
41.2. When is there a large Fourier coefficient?	221
41.3. Gowers norms	222
41.4. Combinatorial number theory	222
41.5. Back to the prime k -tuplets conjecture	222
41.6. If in doubt, generalize	223
Chapter 42. Prime values of higher-degree polynomials	225
42.1. Prime values of polynomials	225
42.2. Prime values of polynomials in several variables	226
42.3. Theorems, “on average”	228
42.4. Prime rich polynomials	229
42.5. Uniformity in these conjectures	230
Chapter 43. Primes in sparse sequences	231
43.1. Second-order linear recurrence sequences	231
43.2. Matrices and asking the right questions	233
43.3. Double exponential growth and dynamical systems	235
43.4. The Gaussian stepping stone problem	236
Appendix A. Probability primer	237
A.1. Binomial distribution	238
A.2. Poisson distribution	239
A.3. Normal distribution	240
A.4. Average vs. typical	240
Appendix B. Counting prime factors with multiplicity	242
B.1. Upper bounds on $N(x; k)$ for $k \leq \kappa \mathcal{L}$ with $\kappa < 2$	242
B.2. A very different formula for $N(x; k)$ when $k \geq (2 + \epsilon) \log \log x$	243
Appendix C. Analytic continuation for certain Dirichlet series	245
Appendix D. Different proofs of the Prime Number Theorem	247
D.1. Selberg’s formula	247
D.2. Why is it easier to prove Selberg’s formula than the PNT?	248

D.3. The Möbius function	249
D.4. The pretentious approach	250
D.5. Using bounds to the right of $\operatorname{Re}(s) = 1$	250
D.6. Tauberian proofs	251
Appendix E. Sketch of technical proofs	252
E.1. Truncating Perron's formula	252
E.2. Bounding the integrand	253
E.3. Contributions going around the original contour	253
E.4. The Tauberian approach (another proof of PNT)	254
Appendix F. Circle method primer	257
F.1. Counting solutions to $a + b = N$ in positive integers a, b	257
F.2. Solutions to $a + b = N$ with $(ab, m) = 1$	258
F.3. A general formulation	259
